(a) All areas of the English Station site where PCB contamination has been found presently are low occupancy areas (a defined term, meaning that a person is present in the area less than 840 hrs/yr and also present less than 16.8 hrs/wk). Since the Station B Parcel is to be sold (for future industrial use), the federal cleanup specifications for high occupancy areas apply to this portion of the site.

(b) For the Station B Parcel, concrete surfaces will be scarified down to the 1 ppm level (and confirmed) rather than the other options, whenever practicable, and debris will be removed for appropriate offsite disposal. Soil will be excavated to achieve a 10 ppm level, with a cap and an ELUR. The 10 ppm level is consistent with the PCB direct exposure criteria for industrial/commercial sites under the Connecticut Remediation Standards Regulations (RSRs). The 1 ppm level is consistent with the PCB direct exposure criteria for residential sites under the RSRs. The ELUR will identify (among other types of residual contamination zones) any PCB residual areas requiring a deed restriction under 40 CFR 761.61. An ELUR is the appropriate CT vehicle for deed restrictions (see below); it will be structured and worded to satisfy the federal requirements, including a designation of property usage.

Table 1 (continued)

PCB Cleanup Specifications for Historical Spills at QE English Station

(c) These are the specifications in the PCB rules at 40 CFR 761.61 for cleanup of historical spills; not the rules for cleanup of fresh spills under the EPA policy at 40 CFR 761.125. "In soil remaining" or "in concrete remaining" means the residual PCB content in those media left onsite unremediated.

(d) A cap comprised of 10 inches of compacted fill, or 6 inches of concrete, or 6 inches of asphalt constitutes satisfactory encapsulation under the federal PCB rules. (The cap required for compliance with the Connecticut RSRs is somewhat different (see below) but satisfies the federal requirement.)

(e) There is no numerical cleanup criterion, because the underlying presumption is that the specified double-wash/rinse technique will render the surface suitable for painting and that the paint will adhere well enough to prevent any contact exposure with residual PCBs remaining in the concrete. If the concrete staining is known to have occurred from contact with oil containing less than 50 ppm PCBs, then cleanup and surface sealing of this sort is not required.

(f) The Connecticut RSRs define just two kinds of uses with respect to direct exposure cleanup criteria: residential use, and commercial/industrial use. The sections of the RSRs that relate to cleanup of PCB-contaminated soils, however, contain provisions that refer (either directly or inferentially) to definitions in the EPA spill cleanup policy at 40 CFR 761.123, as follows:

- *"Residential/commercial area"* means areas where people live or reside, including roads and sidewalks to which the public has access. The nearest area to English Station that is actually zoned residential or commercial is northeast of Grand Ave and Haven St; all the areas closer to the Station are zoned IH or IL (heavy industrial or light industrial). However, Grand Avenue itself is a *residential/commercial area* under this definition because it is open to public access; in addition to transient vehicles and pedestrians, there is occasional public fishing off the Grand Avenue bridge.
- *"Outdoor electrical substation"* means an outdoor, fenced-off restricted access area used for electrical transmission/distribution, and more than 100 m from a residential/commercial area. All of the capacitor and transformer pads at English Station fit this definition; none are closer than 100 m to a zoned residential/commercial area or to Grand Avenue. These areas are delineated on Figure 1.
- *"Other restricted access location"* means areas other than substations that are at least 100 m from a residential/commercial area, *and* are limited by manmade barriers such as fences and walls, or natural barriers. All of English Station is further than 100 m from the nearest zoned residential/commercial area north of Grand Ave and Haven St. Most of English Station (the area south of the approximate center of the coal yard) is further than 100 m from Grand Avenue. The island is surrounded by water on three sides, with a vertical bulkhead wall, and has security gates at the Grand Avenue access. These areas are delineated on Figure 1.
- *"Nonrestricted access area"* means anything not in the above two definitions. At English Station this is the area north of an approximate east-west midline through the coal yard, including Station B and the planned parking area to the south of Station B. These areas are delineated on Figure 1.

(g) The cleanup options in the Connecticut RSRs only apply to soils, not to cleanup of concrete or non-porous materials, and not to sediments. Sediments exist in catch basins on the Station B Parcel; generally, these will be removed if >1 ppm; but if not easily accessible may be left in place (up to the 10 ppm criterion) and simply sealed off. There is a general provision in the RSRs for a variance to allow other cleanup options. Such a variance may be applied for, and reviewed and approved by DEP on a case-by-case basis, but there is no particular expectation that a variance outside of the above numerical cleanup standards would be applied for in this case.

(h) These are the standards for remediation specified in the Connecticut RSRs at RCSA 22a-133k. "In soil remaining" means the residual PCB content in the soils left onsite unremediated.

(i) Rendering the soil "inaccessible" as defined in the RSRs means installing a cap consisting of four feet of soil, or a cap consisting of two feet of soil including a 3-inch concrete or asphalt layer on top. Alternatively, a building can be built over an area to render it inaccessible.

(j) The environmental land use restriction (ELUR) specified in the RSRs has a prescriptive form and content developed by DEP explicitly for site remediation purposes; in this situation, the appropriate language also will be added to comport with federal requirements.

(k) The language discrepancy between RCSA 22a-133k-2(b)(2)(B) for PCBs in residential or "non-restricted access" areas, and RCSA 22a-133k-2(b)(2)(A) for contaminants other than PCBs in those same areas was clarified in a DEP workshop presentation to the Environmental Professionals Organization of Connecticut on March 25, 2003, page 13. So long as the soil is rendered "inaccessible" (which includes an environmental land use restriction), the cleanup criterion is 10 ppm.

Notes for Data Tables

Notes for All Sampling and Analysis Data Tables A1.1 Through A6.2:
1 = Result reported by GEI Consultants, Inc., who did not indicate the result is wet weight. Sample Point not shown on Figures—location not certain.
2 = Result reported by GEI Consultants, Inc., who did not indicate the result is dry weight. Sample Point not shown on Figures—location not certain.
3 = Detection limits were raised due to an interfering pattern of peaks.
4 = Also tested for leachable PCBs using the Synthetic Precipitation Leachate Procedure (SPLP). All were ND except two: 3GP-306 @ 0.3–1.3 feet (= 0.16 µg/L) and 3GP-307 @ 1.3–2.5 feet (= 0.18 µg/L).
5 = Duplicate sample.
6 = Result reported by GEI Consultants, Inc.
7 = Not enough residual sample to test for leachable PCBs using SPLP.
8 = Matrix "stone" includes material identified as crushed stone, gravel, process, or stone.
9 = Detection limits based on sample size supplied for analysis.
10 = Due to the size of the gauze wipe, additional solvent was added to the analysis resulting in the detection limits being raised.
11 = Result reported by United Illuminating laboratory; Minimum Detection Limit (MDL) reportedly = 1.0.
12 = Paint scraped from crane down to bare metal.
13 = Low surrogate recovery; no additional sample available for duplicate analysis.
14 = Surrogate diluted out of curve (out of sample).
15 = Elevated detection limit ≥ RSR criterion. See memo from Complete Environmental Testing, Inc. (CET) in Appendix D1.
16 = Insufficient sample for total solids.
17 = Historic sample—concrete removed by scarification or excision.
18 = Verification sample (hexane wipe or oil) following clean-up of overhead crane, Area 1.4.

General Notes for Figure 5

[01] Several base maps were used for site features and Sample Point locations. These contain some discrepancies that have not been resolved. Locations are approximate.

[02] Structural details have not been shown within enclosures *EN02* and *EN03*.

[03] Enclosures *EN02* and *EN03* are enclosed by four concrete walls. Enclosure is not synonymous with containment.

[04] Callout boxes give the following data: Sample Point identification, date sample was collected, sample depth in feet below original grade (shown in parentheses); and results in milligrams per kilogram.

[05] Reportedly, ND equals "not detected, less than the minimum detection limit (MDL) of 10 milligrams per kilogram".

[06] Four concrete chip samples were taken on 25 June 1998. All were reported as ND. The sampling locations are not known. Locations are also not known for several soil sample points.

[07] Thirty-one soil samples reported collected from the excavation area were also tested for leachable PCBs using the synthetic precipitation leachate procedure (SPLP). SPLP PCBs were not detected in those samples.

[08] Additional recent sample results for this Area are shown on Figures 4N, 4S, 6, A3.3a, and A3.3b. The excavations for PCB Remediation Areas 1, 2, and 3 have been backfilled. Monitoring wells and Geoprobe ® wells shown within Remediation Area 3 no longer exist. Construction of the new bulkhead has been completed.

The United Illuminating Company;

General Notes for Figures 4N & 4S

[N1] Surveyed base maps were used for site features and Sample Point locations. There were some minor discrepancies that have not been resolved. Locations are approximate.

[N2] Not all excavated areas have been shown within buildings and underwater.

[N3] Enclosures (SW) through (SW7) are sediment subset by their respective walls, or by lines drawn with reference to existing bulkheads and remaining walls.

[N4] Four composite pools (seasonally-held equivalent: CP1N, CP1S, CP2N, CP2S) at 0 to 6 inch depth. Not shown are discarded.

[N5] Select Sample Point Subsurface zones (bulkheaded and have not been surveyed, not all Sample Points are assigned.

[N6] Figures 4N and 4S show only those groundwater monitoring wells for which real monitored data are available.

[N7] The format of many Sample Point identification has been modified to facilitate database operations.

[N8] Sample Point identification format in 1998-2004 has the following format: XXX-###. The first number defines the PCB Area as shown on Figure 7.
The two letters define the material as type of sample.
The last two or three numbers give the sample number within the strata.
Duplicate samples are indicated by "D" following the sample number or depth.

[N9] All indicators are sampled samples, definition a depth of 0 inch.
CP1 indicates a composite
